Short phrase description of my professional interests:

Theoretical Physics, Astrophysics, and Cosmology

RESEARCH INTERESTS:

Group theoretical methods in physics and their applications to many-body systems; the geometrical and mathematical foundations of Classical Mechanics, Quantum Mechanics, General Relativity and Cosmology; application of Non-Commutative geometry to Quantum Field Theory in physics.

ACADEMIC EXPERIENCE

Books and Monographs: 1; Reviews: 1, Article publications and preprints: 60+; Conference presentations/participations/posters/invited talks: 70+; abstracts: 14. According to the ResearchGate.net Citation Report (as of Dec, 2021): there are more than 753 citations to papers with my contributions and at least 13 papers with more than 10 citations (more than 1000 contributions according to Google Scholar).

Published in Journals such as: Physical Review Letters, Physical Review C, Astroparticle Physics, American Journal of Physics, International Journal of Modern Physics E, The European Physical Journal A, Journal of Physics A, Journal of Physics G, Journal of High Energy Physics, Revista Mexicana de Fisica, Physics of Elementary Particles and Atomic Nuclei, Monthly Notices of the Royal Astronomical Society

Books, Monographs, and Review Articles

V. G. Gueorguiev, "Mixed-Symmetry Shell-Model Calculations in Nuclear Physics," LAP LAMBERT Academic Publishing AG & Co. KG (2010) [ISBN #978-3-8383-9286-8].
A.M. Maeder and V.G. Gueorguiev, "On the relation of the lunar recession and the length-of-the-day", Astrophysics and Space Science **366** (10), 1-21 (2021).

Brief Bio:

M.S. in Nuclear and Particle Physics from Sofia University, Sofia, Bulgaria;

Thesis Title: "q-Analog of $A_{m-1} \oplus A_{n-1} \subset A_{mn-1}$ "

PhD in Nuclear Physics from Louisiana State University, Baton Rouge, LA, USA;

Dissertation Title: "Mixed-Symmetry Shell-Model Calculations in Nuclear Physics"

NATO fellow at Consejo Superior de Investigaciones Científicas, Madrid, Spain;

Research fellow at Lawrence Livermore National Lab, Livermore, CA, USA;

Physics Lecturer/Instructor at the School of Natural Sciences and the School of Engineering at University of California, Merced, CA, USA;

Physics & Astronomy Lecturer at California State University Stanislaus, Turlock, CA;

Assistant Professor - Sichuan University -Pittsburgh Institute, Chengdu, China;

Current Affiliations: member of the Institute for Advanced Physical Studies, Sofia, Bulgaria and the Ronin Institute for Independent Scholarship, NJ, USA.

DESCRIPTION OF CURRENT RESEARCH TOPICS:

- Quantum computing in its various forms, starting with annealing and gate-based approaches, which are based on superconducting, photonic, atomic, spintronic, and topological qubits' realizations; for the purpose of application to the simulation of many-body physical systems, as well as practical business problems.
- Investigation of the Scale Invariant Vacuum paradigm as related to Weyl Integrable Geometry and its domain of applicability. Starting with the Scale Invariant Cosmology, the early Universe during inflation, the growth of the density fluctuations and structure in the large scale Universe, and the scale-invariant dynamics of Galaxies.
- Research on the Lagrangian and Hamiltonian formulation for the reparametrization-invariant embedding of $d+1$ dimensional manifolds (d -brains) into m -dimensional target spaces and possible quantization procedures of these systems. Some important reparametrization-invariant systems are general relativity, string theory, and the familiar relativistic particle in external electromagnetic and gravitational fields. The proper-time parameterized classical trajectory of the relativistic particle is a one-dimensional object, thus a 0-brain (only time-like points). String theory can be viewed as a two-dimensional extended object having one special and one time-like dimension, thus a type 1-brain manifold with embedding in bigger m -dimensional target spaces. The goal of my research is to understand the physically relevant framework; to classify the Lagrangians and their structure that result in reparametrization-invariant models; to quantify the notion of time for reparametrization-invariant systems and its role in their quantization.
- Investigation of exactly solvable many-body problems and the application of such solutions in the analyses of fundamental interactions and systems such as atomic nuclei and other complex many-body systems. A two-body interaction is often a sufficient ingredient for the description of A -body systems since three- and more particles rarely come in close proximity simultaneously. However, based on the Chiral-Perturbation theory approach to the effective nuclear interaction, it has been shown that three-nucleon interactions in the structure of light nuclei are important. Some of my current research projects aim at exploring the A -body interactions paradigm; in particular, the role of the three- and four- nucleon QCD derived effective interactions in nuclei; as well as charting the limits of applicability of the exactly solvable extended A -body pairing interaction to nuclei and other complex systems.
